Cumulative adjustment exposure

What the control tower shows

- Replenishment risk is evaluated at SKU grain across all warehouse locations: 8 of 300 SKUs are
- Count-control risk is evaluated at SKU/location grain: 6 records need weekly counts and 472 n
- Adjustment exposure is concentrated in two locations: Z3-B03 (106,636.60)andZ2 – B02(104
- Inventory record accuracy is 100.00%, while completion is 94.12%, recount rate is 14.10%, and

Recommended operating response

1. Review the 8 Critical + High SKUs for total supply position, inbound status, and replenishment
2. Execute the 6 weekly and 472 biweekly SKU/location cycle-count assignments.
3. Investigate recurring variance and adjustment exposure at Z3-B03 and Z2-B02.
